Abstract: A standard for high-speed communication devices via electric power lines, so called broadband over power line (BPL) devices, is defined. Transmission frequencies below 100 MHz are used. All classes of BPL devices can use this standard, including BPL devices used for the first-mile/last-mile connection to broadband services as well as BPL devices used in buildings for local area networks (LANs), Smart Energy applications, transportation platforms (vehicle) applications, and other data distribution. The balanced and efficient use of the power line communications channel by all classes of BPL devices is the main focus of this standard, defining detailed mechanisms for coexistence and interoperability between different BPL devices, and ensuring that desired bandwidth and quality of service may be delivered. The necessary security questions are addressed to ensure the privacy of communications between users and to allow the use of BPL for security sensitive services.

Keywords: access devices, adaptive power management, broadband over power lines (BPLs), coexistence protocol (CXP), convolutional turbo code, cosine modulated filter banks, fast Fourier transform orthogonal frequency division multiplexing (FFT OFDM), in-home devices, intersystem protocol (ISP), low-density parity check code (LDPC), medium access control (MAC), power line communication (PLC), physical layer (PHY), privacy, quality of service (QoS), security, sine modulated filter banks, wavelet orthogonal frequency division multiplexing (OFDM)
IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied “AS IS.”

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation, or every ten years for stabilization. When a document is more than five years old and has not been reaffirmed, or more than ten years old and has not been stabilized, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon his or her independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration. A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards Board Operations Manual shall not be considered the official position of IEEE or any of its committees and shall not be considered to be, nor be relied upon as, a formal interpretation of the IEEE. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that his or her views should be considered the personal views of that individual rather than the formal position, explanation, or interpretation of the IEEE.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with IEEE. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Recommendations to change the status of a stabilized standard should include a rationale as to why a revision or withdrawal is required. Comments and recommendations on standards, and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board
445 Hoes Lane
Piscataway, NJ 08854
USA

Authorization to photocopy portions of any individual standard for internal or personal use is granted by The Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to Copyright Clearance Center. To arrange for payment of licensing fee, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.
Introduction

This introduction is not part of IEEE Std 1901-2010, IEEE Standard for Broadband over Power Line Networks: Medium Access Control and Physical Layer Specifications.

This standard was developed on requirements collected from a large diversity of entities (semiconductors, integrators, consumer electronics (CE) companies, utilities, telcos, IT companies, and transportation companies) that participated in the project. It provides a flexible architecture supporting integrated access, Smart Grid, building, in-home, and transportation platforms (vehicle) applications. It addresses a large diversity of topologies. It operates both on alternating (AC) and direct (DC) current lines.

The standard provides efficient medium access control (MAC) procedures that support quality of service (QoS), security, and privacy requirements.

The physical layer (PHY) procedures specify either a wavelet orthogonal frequency division multiplexing (wavelet OFDM) or a fast Fourier transform orthogonal frequency division multiplexing (FFT OFDM) modulation scheme, which are both capable of more than 500 Mbps.

The coexistence procedures allow the fair and efficient coexistence of the broadband over power line (BPL) systems. The intersystem protocol (ISP) enables various BPL systems to share power line communication resources in time (time domain multiplex), in frequency (frequency domain multiplex), or both.

This standard includes diagnostics and management capabilities as needed by the end users.

Notice to users

Laws and regulations

Users of these documents should consult all applicable laws and regulations. Compliance with the provisions of this standard does not imply compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

Copyrights

This document is copyrighted by the IEEE. It is made available for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making this document available for use and adoption by public authorities and private users, the IEEE does not waive any rights in copyright to this document.

Updating of IEEE documents

Users of IEEE standards should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect. In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit the IEEE Standards Association web site at http://ieeexplore.ieee.org/xpl/standards.jsp, or contact the IEEE at the address listed previously.
For more information about the IEEE Standards Association or the IEEE standards development process, visit the IEEE-SA web site at http://standards.ieee.org.

**Errata**

Errata, if any, for this and all other standards can be accessed at the following URL: http://standards.ieee.org/reading/ieee/updates/errata/index.html. Users are encouraged to check this URL for errata periodically.

**Interpretations**

Current interpretations can be accessed at the following URL: http://standards.ieee.org/reading/ieee/interp/index.html.

**Patents**

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. A patent holder or patent applicant has filed a statement of assurance that it will grant licenses under these rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses. Other Essential Patent Claims may exist for which a statement of assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.
Participants

This entity-based standard was created under the leadership of the following individuals:

Jean-Philippe Faure, Chair
James D. Allen, Vice Chair, PHY/MAC Technical Sub Group Chair
Michael Stelts, Coexistence Technical Sub Group Chair
Purva Rajkotia, GC PHY/MAC Technical Sub Group Chair
Roger C. vonDoenhoff, Transportation Sub Group Chair
Stephan Horvath, BPL/VDSL Sub Group Chair
Sherman Gavette, Technical Editor

At the time this standard was approved, the Broadband Over Power Lines PHY/MAC Working Group had the following entity membership:

ACN Advanced Communications Networks SA
Arkados Group, Inc.
Atheros Communications
Consumer Electronics Powerline Communication Alliance (CEPCA)
Consumers Energy
devol AG

Gigle Networks
HD-PLC Alliance
HomePlug Powerline Alliance, Inc.
Kawasaki Microelectronics, Inc.
MainNet Communications Ltd.
Marvell Switzerland Sarl

Mitsubishi Electric Corporation
Panasonic Corporation of America
Power Plus Communications AG
Siemens AG
Sony Corporation
SPIDCOM Technologies SA
The Boeing Company
Watteco sas

The Working Group gratefully acknowledges the contributions of the following entities and participants. Without their assistance and dedication, this standard would not have been completed.

1 Overview

1.1 Scope
The project defines a standard for high-speed (>100 Mbps at the physical layer) communication devices via electric power lines, so-called broadband over power line (BPL) devices. This standard uses transmission frequencies below 100 MHz. It is usable by all classes of BPL devices, including BPL devices used for the first-mile/last-mile connection (<1500 m to the premise) to broadband services as well as BPL devices used in buildings for local area networks (LANs), smart energy applications, transportation platform (vehicle) applications, and other data distribution (<100 m between devices). This standard focuses on the balanced and efficient use of the power line communications channel by all classes of BPL devices, defining detailed mechanisms for coexistence and interoperability between different BPL devices, and assuring that desired bandwidth and quality of service may be delivered. The standard addresses the necessary security questions to provide privacy of communications between users and allow the use of BPL for security-sensitive services. It is limited to the physical layer and the medium access sublayer of the data link layer, as defined by the International Organization for Standardization (ISO) Open Systems Interconnection (OSI) Basic Reference Model.

1.2 Purpose
New modulation techniques offer the possibility to use the power lines for high-speed communications. This new high-speed medium is open and locally shared by several BPL devices. Without an independent, openly defined standard, BPL devices serving different applications will conflict with one another and provide unacceptable service to all parties. The standard will provide a minimum implementation subset that allows fair coexistence of the BPL devices. The full implementation will provide interoperability among BPL devices, as well as interoperability with other networking protocols, such as bridging for seamless interconnection via IEEE Std 802.1X™-2010.1 It is also the intent of this effort to progress quickly toward a robust standard so power

---

1 Information on references can be found in Clause 2.
line applications may begin to impact the marketplace. The standard also complies with electromagnetic compatibility (EMC) limits set by national regulators, so as to enable successful coexistence with wireless and telecommunications systems.

1.3 Protocols
The defined protocols provide connectivity over power lines to automatic machinery, equipment, or stations that are connected to power lines, including:

- Functions and services required by an IEEE-1901-conformant device to operate within networks as well as the aspects of station portability (relocation) within those networks.
- Medium access control (MAC) procedures to support the asynchronous MAC service data unit (MSDU) delivery services.
- Physical layer (PHY) signaling techniques and interface functions that are controlled by the IEEE 1901 MAC.
- Operation of an IEEE-1901-conformant device within a power line network that coexists with multiple other overlapping IEEE 1901 power line networks, automatically and without user intervention. Two modes of coexistence operation are defined:
  1) Inter-system protocol (ISP) allows IEEE-1901-conformant devices, ITU-T G.hn devices, and low-rate wideband service devices to coexist.
- Requirements and procedures to enable security, data integrity and confidentiality of user information being transferred over the power line and authentication of IEEE-1901-conformant devices.
- Mechanisms for dynamic notching (DN), dynamic frequency selection (DFS), and transmit power control (TPC).
- Mechanisms for shaping the power spectral density (PSD).
- MAC procedures to support network applications with quality-of-service (QoS) requirements.
- Complete set of variables that govern the conditional requirements of this standard (see Annex A).

1.4 Overview of annexes
This subclause lists all of the annexes contained in this standard:

- Annex B (normative) Optional filters for the bandpass wavelet OFDM: contains some normative tables that were placed in the annexes because of their size.
- Annex C (informative) Beacon-triggered TDMA scheduling examples: provides examples of beacon-triggered, time division multiple access (TDMA) scheduling used for different types of traffic streams.
- Annex D (informative) RSNA reference implementations and test vectors: provides test vectors for robust security network association (RSNA) implementation for pseudo-random function (PRF) and counter mode (CTR) with CBC message authentication code (CBC-MAC) protocol (CCMP).
- Annex E (informative) Integration function: describes an integration service between a non–IEEE-802.3 network and a IEEE 1901 portal and comparison with IEEE 802.1 bridging functionality.
— Annex F (informative) Channel and noise analysis and models for BPL systems: provides informative material regarding BPL channel and noise models.

— Annex G (informative) Priority mapping: provides the recommended mapping between user priority identifiers (IDs) and user applications.

— Annex H (informative) DSN in-home security—user experiences (UEs): describes the typical user experience with IEEE 1901 station (STA) in a basic service set (BSS) implementing a device-based security network (DSN).

— Annex I (informative) DSN in-home security—state transition diagrams: describes a state machine for DSN in-home security and key management.

— Annex J (informative) DSN in-home security—test vectors: provides test vectors for DSN in-home implementation for hashed network membership key (NMK), hashed network identifier (NID) and NMK provisioning management message entry (MME) using device access key (DAK).

— Annex K (informative) Bridging and routing that use 1901 FFT stations as one or more of their portals: provides an explanation and examples for IEEE 1901 end-to-end bridging and station-to-station routing in both in-home and access segments.

— Annex L (informative) FFT parameters: describes FFT parameters for PHY and MAC and multiple networks scenarios for different network modes.

— Annex M (informative) 1901 FFT and TIA-1113 coexistence: describes coexistence between IEEE 1901 FFT STAs and legacy TIA-1113 STAs.

— Annex N (informative) Fair share between 1901 access and 1901 in-home using the same PHY: describes fair medium sharing between the IEEE 1901 access network and the IEEE 1901 in-home network, which are using the same PHY.

— Annex O (informative) 1901 access and 1901 in-home synchronization and interoperability: describes a method for IEEE 1901 access and IEEE 1901 in-home to synchronize on the same PHY scheme for achieving full interoperability.

— Annex P (normative) Optional coexistence protocol: specifies an optional coexistence protocol (CXP) between IEEE-1901-conformant systems and systems that implement only CXP but are not IEEE 1901-conformant.

— Annex Q (informative) Resource request and allocation: describes coexistence resource request and allocation between in-home systems and between in-home systems and access systems.

— Annex S (informative) Examples of the coexistence protocol handling hidden node systems: provides examples for coexistence protocol handling of hidden node systems.

— Annex T (informative) Flowcharts of CX Protocol: provides examples of detailed flowcharts for the CXP.

— Annex U (informative) Zero-cross point detection circuit: describes a recommended zero-cross point detection circuit.

— Annex V (informative) Transmit spectrum mask example: shows a transmit spectrum mask example of the upper bound of the power spectral density (PSD).

— Annex W (informative) CDCF signals: description and definition of CXP’s commonly distributed coordination function (CDCF) signal generation and reception
